NTE4053B & NTE4053BT Integrated Circuit CMOS, Analog, Triple 2-Channel Multiplexer

Description:

The NTE4053B (16-Lead DIP) and NTE4053BT (SOIC-16) analog multiplexers are digitally-controlled analog switches. These devices effectively implement a Triple SPDT solid state switch and feature low ON impedance and very low OFF leakage current. Control of analog signals up to the complete supply voltage range can be achieved.

Features:

- Triple Diode Protection on Control Inputs
- Switch Function is Break Before make
- Supply Voltage Range: 3Vdc to 18Vdc
- Analog Voltage Range ($V_{DD} - V_{EE}$): 3Vdc to 18Vdc (Note: V_{EE} must be $\leq V_{SS}$)
- Linearized Transfer Characteristics
- Low-Noise - $12nV / \sqrt{\text{Cycle}}$, $f \geq 1kHz$ Typ

Absolute Maximum Ratings: (Voltages referenced to V_{SS} , Note 1, Note 2)

DC Supply Voltage, V_{DD}	-0.5 to +18.0V
Input Voltage (DC or Transient), V_{in} (Referenced to V_{SS} for Control Inputs and V_{EE} for Switch I/O)	-0.5 to V_{DD} to +0.5V
Output Voltage (DC or Transient), V_{out} (Referenced to V_{SS} for Control Inputs and V_{EE} for Switch I/O)	-0.5 to V_{DD} to +0.5V
Input Current (DC or Transient, Per Pin), I_{in}	$\pm 10mA$
Switch Through Current, I_{SW}	$\pm 25mA$
Power Dissipation (Per Package), P_D	500mW
Temperature Derating (from +65° to +125°C)	-7.0mW/°C
Ambient Temperature Range, T_A	-55° to +125°C
Storage Temperature Range, T_{stg}	-65° to +150°C
Lead Temperature (During Soldering, 8sec max), T_L	+260°C

Note 1. Stresses exceeding maximum Ratings may damage the device. Maximum Ratings are stress ratings only. Functional operation above the Recommended Operating Conditions is not implied. Extended exposure to stresses above the Recommended Operating Conditions may affect device reliability.

Note 2. These devices contain protection circuitry to guard against damage due to high static voltages or electric fields. However, precautions must be taken to avoid applications of any voltage higher than maximum rated voltages to this high-impedance circuit. For proper operation, V_{in} and V_{out} should be constrained to the range $V_{SS} \leq (V_{in} \text{ or } V_{out}) \leq V_{DD}$.

Unused inputs must always be tied to an appropriate logic voltage level (e.g. either V_{SS} , V_{EE} or V_{DD}), Unused outputs must be left open.

Note 3. Data labeled "Typ" is not to be used for design purposes but is intended as an indication of the device's potential performance.

Note 4. For voltage drops across the switch (ΔV_{switch}) > 600mV (> 300mV at high temperatures), excessive V_{DD} current may be drawn, i.e. the current out of the switch may contain both V_{DD} and switch input components. The reliability of the device will be unaffected unless the Maximum Ratings are exceeded (See the first page of this data sheet).
